ABSTRACT:

Novel group B streptogramin-like compounds of general formula (I), and a method for preparing streptogramins by mutasynthesis using a mutated micro-organism to influence the biosynthesis of at least one of the precursors of group B streptogramins are disclosed. Novel nucleotide sequences involved in the biosynthesis of said precursors, and their uses, are also disclosed.

US-CL-CURRENT: 536/23.1; 435/183, 435/252.3, 435/320.1, 435/69.1, 536/23.2,
536/24.3, 536/24.32, 536/24.33

ABSTRACT:

The present invention pertains to polynucleotides derived from staphylococcal genes encoding resistance to streptogramin A or to streptogramin B and chemically related compounds. This invention also relates to the use of the polynucleotides as oligonucleotide primers or probes for detecting Staphylococcal strains that are resistant to streptogramin A or to streptogramin B and related compounds in a biological sample. In another embodiment, the present invention is directed to the full length coding sequences of the staphylococcal genes encoding for resistance to streptogramin A or to streptogramin B from Staphylococcus and to the polypeptides expressed by these full length coding sequences. Further, this invention relates to the use of the expressed polypeptides to produce specific monoclonal or polyclonal antibodies that serve as detection means in order to characterize any staphylococcal strain carrying genes encoding resistance to streptogramin A or to streptogramin B.

ABSTRACT:

This invention related to an isolated nucleic acid fragment encoding a tryptophan biosynthetic enzyme. This invention also related to the construction of a Chimeric gene encoding all or a portion of the tryptophan biosynthetic enzyme, in sense or antisense orientation, wherein expression of the Chimeric gene results in the production of altered levels of the tryptophan biosynthetic enzyme in a transformed host cell. The tryptophan biosynthetic enzymes include anthranilate phosphoribosyltransferase (E.C. 2.4.2.18) from corn (*Zea mays*), soybean (*Glycine max*) and wheat (*Triticum aestivum*); indole-3-glycerol phosphate synthase (E.C. 4.1.1.48) from corn (*Zea mays*), rice (*Oryza sativa*), soybean (*Glycine max*), and wheat (*Triticum aestivum*); and phosphoribosylanthranilate isomerase (E.C. 5.3.1.24) from corn (*Zea mays*), rice (*Oryza sativa*), (and wheat (*Triticum aestivum*)).

ABSTRACT:

The invention provides a method for preparing streptogramins using genetically-modified microorganisms to influence the biosynthesis of at least one of the precursors of the group B streptogramins. Cultures of the genetically-modified microorganisms are supplemented with a least one precursor that is different from the streptogramin precursor whose biosynthesis is altered and the streptogramins produced are recovered.

TITLE: Picromycin resistance-conferring gene, designated pica, for use in streptomyces and other organisms

DATE-ISSUED: October 15, 1991

INVENTOR-INFORMATION:

NAME	CITY	STATE	ZIP CODE	COUNTRY
Stanzak; Richard K.	Poland	IN		

US-CL-CURRENT: 435/252.3; 435/169, 435/252.33, 435/252.35, 435/320.1, 435/34,
435/69.1, 435/71.1, 435/886, 435/91.41, 536/23.7

ABSTRACT:

A novel gene conferring resistance to picromycin in Streptomyces and related organisms was cloned from a genomic library of Streptomyces felleus DNA. The novel picromycin resistance-conferring gene can be isolated on an about 2.8 kb PvuII fragment by subcloning the restriction fragment from plasmid pOJ321. This PvuII fragment contains all of the information required for the expression of the picromycin resistant phenotype in Streptomyces. Methods for inducing resistance, as well as vectors and transformants containing the novel picromycin resistance gene, are provided.

ABSTRACT:

The present invention is a method for isolating antibiotic biosynthetic genes. To practice the method, an antibiotic resistance-conferring DNA segment is labelled and used as a probe to find, via DNA hybridization, homologous DNA in a genetic library which comprises chromosomal and plasmid DNA of an antibiotic-producing organism. Individual vectors of the genetic library which hybridize to the antibiotic resistance-conferring gene, and which comprise about 1-45 kb of contiguous DNA from the antibiotic-producing organism, which also comprise an antibiotic biosynthetic gene. The present method is exemplified by using the erythromycin resistance-conferring gene of *Streptomyces erythreus* to clone the erythromycin biosynthetic pathway from the same organism. The erythromycin biosynthetic pathway isolated with the present method synthesizes erythromycin when introduced into *S. lividans* TK23.

ABSTRACT:

A novel gene conferring resistance to spiramycin in Streptomyces and related organisms was cloned from a genomic library of Streptomyces ambofaciens DNA. A thirty-one Kb fragment of S. ambofaciens DNA including the spiramycin-resistance gene was isolated from this library on a cosmid designated pKC592. The novel spiramycin-resistance gene can be isolated on an .about.2.9 Kb BamHI fragment by subcloning restriction fragments obtained from the pKC592 insert DNA. This BamHI fragment contains all of the information required for the expression of the spiramycin resistant phenotype in Streptomyces. Vectors and transformants containing the novel spiramycin resistance gene are provided.
